1.6MHz Bandwidth, Micropower Low Noise Op-amps

Features

- **Low Noise: 13nV/√Hz(f= 1kHz)**
- **Supply Current: 190μA/ch**
- **Offset Voltage: 1 mV (max)**
- **Low THD+N: 0.0005%**
- **Supply Range: 2.2V to 5.5V**
- **Low Input Bias Current: 0.3pA Typical**
- **EMIRR IN+: 85 dB(under 2.4GHz)**
- **Slew Rate: 0.9 V/μs**
- **Gain-bandwidth Product: 1.6MHz**
- **Rail-to-Rail I/O**
- **High Output Current: 70mA (1.0V Drop)**
- **–40°C to 125°C Operation Range**

Applications

- Portable Equipment
- Battery-Powered Instruments
- Data Acquisition and Control
- Low-Voltage Signal Conditioning
- Communications
- Security

Description

The single TP2431, dual TP2432, and quad TP2434 operational amplifiers combine excellent DC accuracy with Rail-to-Rail operation at the input and output. Since the common-mode voltage extends from VCC to VEE, the devices can operate from either a single supply (2.2V to 5.5V) or split supplies (±1.1V to ±2.75V). Each op amp requires less than 190μA of supply current. Even with this low current, the op amps are capable of driving a 1kΩ load, and the input-referred voltage noise is only 13nV/√Hz. In addition, these op amps can drive loads in excess of 2000pF.

The precision performance of the TP2431/TP2432/ TP2434 combined with their wide input and output dynamic range, low-voltage, single-supply operation, and very low supply current, make them an ideal choice for battery-operated equipment, industrial, and data acquisition and control applications.

The TP2431 is single channel version available in 8-pin SOP and 5-pin SOT23 packages. The TP2432 is dual channel version available in 8-pin SOP and MSOP packages. The TP2434 is quad channel version available in 14-pin SOP and TSSOP packages.

Order Information

Model Name	Order Number	Package	Transport Media, Quantity	Marking Information
TP2431	TP2431-TR	5-Pin SOT23	Tape and Reel, 3,000	431
	TP2431U-TR	5-Pin SOT23	Tape and Reel, 3,000	43U
TP2432	TP2432-SR	8-Pin SOP	Tape and Reel, 4,000	TP2432
	TP2432-VR	8-Pin MSOP	Tape and Reel, 3,000	TP2432
TP2434	TP2434-SR	14-Pin SOP	Tape and Reel, 2,500	TP2434
	TP2434-TR	14-Pin TSSOP	Tape and Reel, 3,000	TP2434

Absolute Maximum Ratings Note 1

Supply Voltage: $V^+ – V^-$ Note 2 ..... 7.0V
Input Voltage..... V^- – 0.3 to V^+ + 0.3
Input Current: +IN, –IN Note 3 ..... ±20mA
Output Current: OUT..... ±160mA
Output Short-Circuit Duration Note 4 ..... Indefinite

Current at Supply Pins……..... ±60mA
Operating Temperature Range.....–40°C to 125°C
Maximum Junction Temperature..... 150°C
Storage Temperature Range..... –65°C to 150°C
Lead Temperature (Soldering, 10 sec) ..... 260°C

Note 1: Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. Exposure to any Absolute Maximum Rating condition for extended periods may affect device reliability and lifetime.

Note 2: The op amp supplies must be established simultaneously, with, or before, the application of any input signals.

Note 3: The inputs are protected by ESD protection diodes to each power supply. If the input extends more than 500mV beyond the power supply, the input current should be limited to less than 10mA.

Note 4: A heat sink may be required to keep the junction temperature below the absolute maximum. This depends on the power supply voltage and how many amplifiers are shorted. Thermal resistance varies with the amount of PC board metal connected to the package. The specified values are for short traces connected to the leads.

ESD, Electrostatic Discharge Protection

Symbol	Parameter	Condition	Minimum Level	Unit
HBM	Human Body Model ESD	ANSI/ESDA/JEDEC JS-001	4	kV
CDM	Charged Device Model ESD	ANSI/ESDA/JEDEC JS-002	1	kV

Thermal Resistance

Package Type	θ_{JA}	θ_{JC}	Unit
5-Pin SOT23	250	81	°C/W
8-Pin SOP	158	43	°C/W
8-Pin MSOP	210	45	°C/W
14-Pin SOP	120	36	°C/W
14-Pin TSSOP	180	35	°C/W

Electrical Characteristics

The specifications are at T_A = 27°C. VS = +2.7 V to +5.5 V, or ±1.35 V to ±2.75 V, R_L = 2kΩ, C_L =100pF.Unless otherwise noted.

SYMBOL	PARAMETER	CONDITIONS	MIN	TYP	MAX	UNITS
V_{OS}	Input Offset Voltage	V_{CM} = V_{DD}/2	-1	±0.3	+1	mV

Pin Functions

-IN: Inverting Input of the Amplifier.
+IN: Non-Inverting Input of Amplifier.
OUT: Amplifier Output. The voltage range extends to within mV of each supply rail.
V+ or +V_S: Positive Power Supply. Typically the voltage is from 2.2V to 5.5V. Split supplies are possible as long as the voltage between V+ and V– is between 2.2V and 5.5V. A bypass capacitor of 0.1µF as close to the part as possible should be used between power supply pins or between supply pins and ground.
V- or -V_S: Negative Power Supply. It is normally tied to ground. It can also be tied to a voltage other than ground as long as the voltage between V_+ and $V_–$ is from 2.2V to 5.5V. If it is not connected to ground, bypass it with a capacitor of 0.1µF as close to the part as possible.

Operation

The TP2431/TP2432/TP2434 can operate from a single +2.2V to +5.5V power supply, or from ±1.1V to ±2.75V power supplies. The power supply pin(s) must be bypassed to ground with a 0.1µF capacitor as close to the pin as possible. The single TP2431, dual TP2432 and quad TP2434 op amps combine excellent DC accuracy with rail-to-rail operation at both input and output. With their precision performance, wide dynamic range at low supply voltages, and very low supply current, these op amps are ideal for battery-operated equipment, industrial, and data acquisition and control applications.

Applications Information

Rail-to-Rail Inputs and Outputs

The TP243x op amps are designed to be immune to phase reversal when the input pins exceed the supply voltages, therefore providing further in-system stability and predictability. Figure 1 shows the input voltage exceeding the supply voltage without any phase reversal.

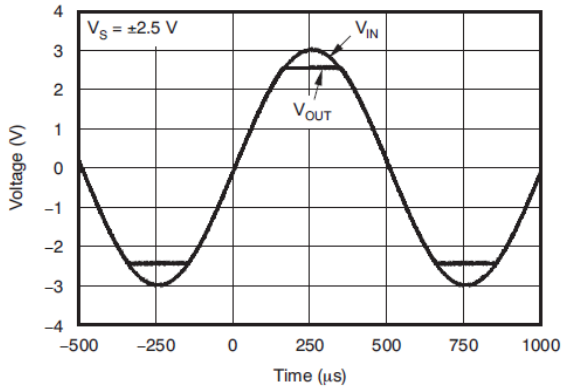

Figure 1. No Phase Reversal

Input ESD Diode Protection

The TP2431 incorporates internal electrostatic discharge (ESD) protection circuits on all pins. In the case of input and output pins, this protection primarily consists of current-steering diodes connected between the input and power-supply pins. These ESD protection diodes also provide in-circuit input overdrive protection, as long as the current is limited to 10 mA as stated in the Absolute Maximum Ratings table. Many input signals are inherently current-limited to less than 10 mA; therefore, a limiting resistor is not required. Figure 2 shows how a series input resistor (RS) may be added to the driven input to limit the input current. The added resistor contributes thermal noise at the amplifier input and the

value should be kept to the minimum in noise-sensitive applications.

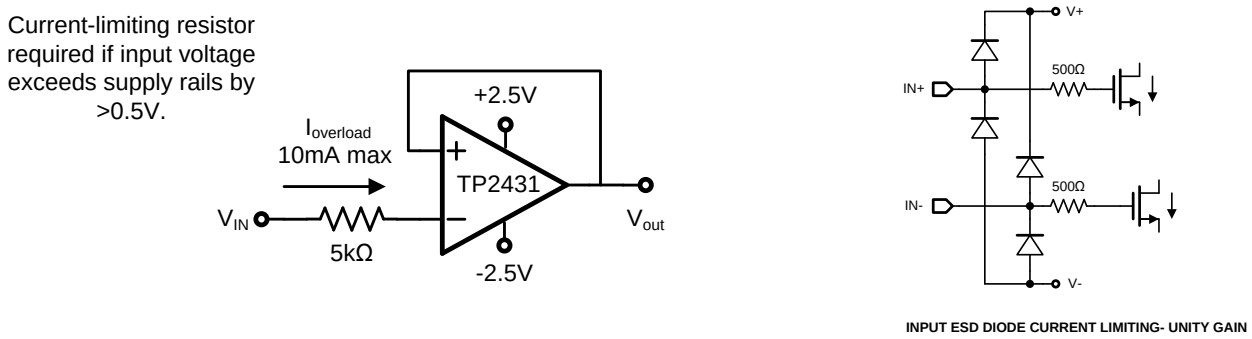

Figure 2. Input ESD Diode

EMI Susceptibility and Input Filtering

Operational amplifiers vary in susceptibility to electromagnetic interference (EMI). If conducted EMI enters the device, the dc offset observed at the amplifier output may shift from the nominal value while EMI is present. This shift is a result of signal rectification associated with the internal semiconductor junctions. While all operational amplifier pin functions can be affected by EMI, the input pins are likely to be the most susceptible. The TP2431 operational amplifier family incorporates an internal input low-pass filter that reduces the amplifier response to EMI. Both common-mode and differential mode filtering are provided by the input filter. The filter is designed for a cutoff frequency of approximately 400 MHz (–3 dB), with a roll-off of 20 dB per decade.

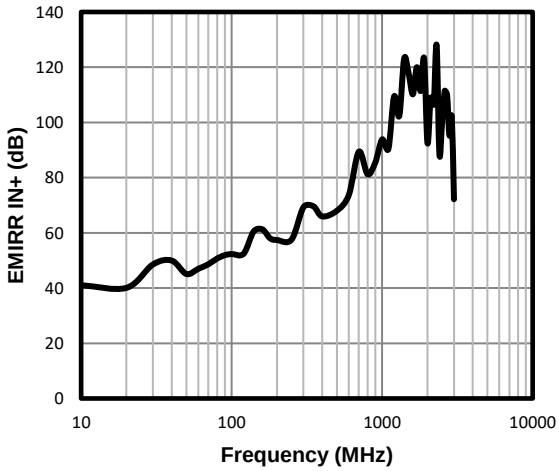

Figure 3. TP2431 EMIRR IN+ vs Frequency

PCB Surface Leakage

In applications where low input bias current is critical, Printed Circuit Board (PCB) surface leakage effects need to be considered. Surface leakage is caused by humidity, dust or other contamination on the board. Under low humidity conditions, a typical resistance between nearby traces is $10^{12}\Omega$. A 5V difference would cause 5pA of current to flow, which is greater than the TP2431/2432/2434 OPA's input bias current at +27°C (±0.3pA, typical). It is recommended to use multi-layer PCB layout and route the OPA's -IN and +IN signal under the PCB surface.

The effective way to reduce surface leakage is to use a guard ring around sensitive pins (or traces). The guard ring is biased at the same voltage as the sensitive pin. An example of this type of layout is shown in Figure 6 for Inverting Gain application.

1. For Non-Inverting Gain and Unity-Gain Buffer:
   a) Connect the non-inverting pin (V_{IN}+) to the input with a wire that does not touch the PCB surface.
   b) Connect the guard ring to the inverting input pin (V_{IN}–). This biases the guard ring to the Common Mode input voltage.
2. For Inverting Gain and Trans-impedance Gain Amplifiers (convert current to voltage, such as photo detectors):
   a) Connect the guard ring to the non-inverting input pin (V_{IN}+). This biases the guard ring to the same reference voltage as the op-amp (e.g., V_{DD}/2 or ground).
   b) Connect the inverting pin (V_{IN}–) to the input with a wire that does not touch the PCB surface.

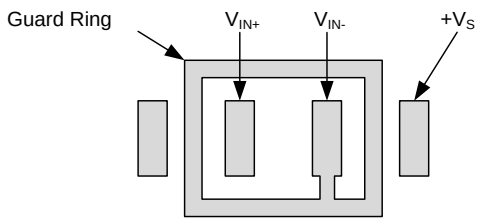

Figure 4 The Layout of Guard Ring

Power Supply Layout and Bypass

The TP2431/2432/2432 OPA's power supply pin (V_{DD} for single-supply) should have a local bypass capacitor (i.e., 0.01μF to 0.1μF) within 2mm for good high frequency performance. It can also use a bulk capacitor (i.e., 1μF or larger) within 100mm to provide large, slow currents. This bulk capacitor can be shared with other analog parts.

Ground layout improves performance by decreasing the amount of stray capacitance and noise at the OPA's inputs and outputs. To decrease stray capacitance, minimize PC board lengths and resistor leads, and place external components as close to the op amps' pins as possible.

Proper Board Layout

To ensure optimum performance at the PCB level, care must be taken in the design of the board layout. To avoid leakage currents, the surface of the board should be kept clean and free of moisture. Coating the surface creates a barrier to moisture accumulation and helps reduce parasitic resistance on the board.

Keeping supply traces short and properly bypassing the power supplies minimizes power supply disturbances due to output current variation, such as when driving an ac signal into a heavy load. Bypass capacitors should be connected as closely as possible to the device supply pins. Stray capacitances are a concern at the outputs and the inputs of the amplifier. It is recommended that signal traces be kept at least 5mm from supply lines to minimize coupling.

A variation in temperature across the PCB can cause a mismatch in the Seebeck voltages at solder joints and other points where dissimilar metals are in contact, resulting in thermal voltage errors. To minimize these thermocouple effects, orient resistors so heat sources warm both ends equally. Input signal paths should contain matching numbers and types of components, where possible to match the number and type of thermocouple junctions. For example, dummy components such as zero value resistors can be used to match real resistors in the opposite input path. Matching components should be located in close proximity and should be oriented in the same manner. Ensure leads are of equal length so that thermal conduction is in equilibrium. Keep heat sources on the PCB as far away from amplifier input circuitry as is practical.

The use of a ground plane is highly recommended. A ground plane reduces EMI noise and also helps to maintain a constant temperature across the circuit board.
