### Description

The TPT772x devices are high-performance, dual-channel enhanced digital isolators with 5000- $V_{\text{RMS}}$  (WSOP8, WSOP16), and 3750- $V_{\text{RMS}}$  (SOP8) isolation ratings per UL 1577. These devices have also been certified by VDE, UL, CSA, TUV, CQC, and CB.

The TPT772x devices provide high reliability and high performance at low power consumption with isolating digital input and output. Each isolation signal channel is separated by a double capacitive silicon dioxide insulation barrier. The TPT7720 device has both channels in the same direction while the TPT7721 devices have both channels in the opposite direction. In the event of input power or signal loss, the fail-safe default output is low for devices with the suffix F and high for devices without the suffix F.

The common mode transient immunity (CMTI) and electromagnetic compatibility of the TPT772x devices have been significantly enhanced through innovative circuit design and optimized structure.

The TPT772x family is available in SOP8, WSOP8, and WSOP16 packages, and is characterized from  $-40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$ . Devices are qualified for automotive applications with AEC-Q100 Reliability Test.

## Detailed Description

### Overview

The TPT772x family utilize an ON-OFF Keying (OOK) modulation circuit to transmit the digital data through the isolation barrier. The transmitter sends a RF carrier to represent digital state one and sends no signal to represent the digital state zero. The devices also utilize advanced circuit design to maximise CMTI performance and minimise radiated emissions. The block diagram below shows a functional block diagram of a typical channel.

Power up	Power up	High	High	Normal Operation
		Low	Low	
		Open	Default	Default mode. The default is High for TPT772x and Low for TPT772xF.
Power down	Power up	X	Default	Default mode: When VCC <sub>I</sub> is unpowered, the default is High for TPT772x and Low for TPT772xF.
X	Power down	X	Undetermined	When VCC <sub>O</sub> is unpowered, a channel output is undetermined.

(1) VCC<sub>I</sub> = Input-side V<sub>CCA</sub>; VCC<sub>O</sub> = Output-side V<sub>CCB</sub>; Powered up (V<sub>CC</sub> ≥ 2.25 V); Powered down (V<sub>CC</sub> ≤ 1.7 V); X = Irrelevant

(2) The outputs are in the undetermined state when 1.7 V < VCC<sub>I</sub>, VCC<sub>O</sub> < 2.25 V.

## Application and Implementation

### Note

Information in the following application sections is not part of the 3PEAK's component specification and 3PEAK does not warrant its accuracy or completeness. 3PEAK's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

## Typical Application

Figure 7 is the TPT772x typical application. The two external bypass capacitors need to be close to the VCC power pin. The maximum distance is 2 mm.
